Assignment 1: HTML

Part 1: Planning

My current career aspirations are to simply be employed and to have job security in the field of Computer Science after graduating from Dalhousie. However, I do wish for my job to be related to programming and what a programmer's roles/tasks would entail. This website will include plenty of details and information that would be found on a resume. For example, Job Experience, Education, Skills, Awards, etc. I believe that having the listed details and info on the website would help me in finding a job, as many employers look for these aspects surrounding an employee and what type of employee they may be dealing with. The website will also feature links to programs and projects related to computing. This is so that employers could get an idea and grasp of how I code and the level of my work, whether it meets their needs and standards. Included on the website will be my contact and social media info, i.e., Phone Number, e-mail, Instagram, etc. I think that including the listed info allows employers to do more research about me if they're interested in me as a potential hire. They could start a conversation with me through a series of phones calls, texts, messages or emails. They could even learn more about me and a bit of my personal life through social media. Finally, the website will have an "About me" page. I believe having this page could give patrons insight into my personality and values as a person, these are aspects and traits that I think plenty of employers search for and pay a lot of attention to. I plan on creating a website that would really catch employers eyes through simplicity, organization and more!
